## Features

### Objective

The index is designed for use in the creation of index tracking funds, derivatives and as a performance benchmark.

### Transparency

The index uses a transparent, rules-based construction process. Index rules are freely available on FTSE Russell's website.

### Investability

Stocks are selected and weighted to ensure practical index implementation into investment products.

### Availability

The index is calculated based on price and total return methodologies, both real time intra-second and end-of-day.

### Liquidity

Stocks are screened to ensure that investors can replicate the index.

### Industry Classification Benchmark

Index constituents are categorized in accordance with the Industry Classification Benchmark (ICB®), a globally recognized standard for categorizing companies and securities, operated and managed by FTSE Russell.

## Did you know?

24,900 miles round the Earth

### Radius, diameter and circumference of planet Earth

The mean radius of planet Earth is 3,959 miles (6,371 kilometers). However, Earth is not quite a sphere. The planet's rotation causes it to bulge at the equator. Earth's equatorial diameter is 7,926 miles (12,756 km), but from pole to pole, the diameter is 7,898 miles (12,714 km) – a difference of only 28 miles (42 km). The circumference of Earth at the equator is about 24,874 miles (40,030 km), but from pole-to-pole – the meridional circumference – Earth is only 24,860 miles (40,008 km) around. This shape, caused by the flattening at the poles, is called an oblate spheroid.

### Density, mass and volume

Earth's density is 5.513 grams per cubic centimeter. Earth is the densest planet in the solar system because of its metallic core and rocky mantle. Jupiter, which is 318 times more massive than Earth, is less dense because it is made of gases, such as hydrogen. Earth's mass is 6.6 sextillion tons (5.9722 x 10<sup>24</sup> kilograms). Its volume is about 260 billion cubic miles (1 trillion cubic kilometers).

### How fast would you have to travel to see the sun set twice, or outrun the shadow of the setting sun?

Since the sun "travels" once around Earth every 24 hours, we can get the speed by dividing the equatorial circumference of the Earth by 24: Miles divided by hours = 24,874 / 24 = 1,036.42 miles per hour.
